Are You Eating Pork Injected With Merck's mRNA Livestock Vaccine?

Since 2018, industrial pork producers have been using customizable mRNA-based "vaccines" on their herds. According to drugmaker Merck, the vaccines target "existing and evolving swine pathogens, including diseases not covered by conventional swine vaccines."

By Dr. Joseph Mercola

Miss a day, miss a lot. *Subscribe to The Defender's Top News of the Day.* ***It's free.***

Story at a glance:

- For the last couple of years, I've recommended not eating pork due to its high linoleic acid (LA) content, but there's an even bigger reason to avoid it now. Since 2018, pork producers have been using customizable mRNA-based "vaccines" on their herds.
- The very first RNA-based livestock vaccine, a swine influenza (H3N2) RNA shot licensed in 2012, was developed by Harrisvaccines. The company followed up with an avian influenza mRNA shot in 2015. Harrisvaccines was acquired by Merck Animal Health later that year.
- CureVac developed an mRNA-based rabies shot for pigs in 2016.
- The swine vaccine platform Sequivity, introduced in 2018, was developed by Merck in partnership with Moderna. Sequivity can produce endlessly customized "vaccines," none of which undergo safety testing.
- Americans have been eating pork treated with gene therapy for nearly five years already, and even more of our meat supply is about to get the same treatment. mRNA-lipid nanoparticle shots for avian influenza are in the works, as are mRNA shots for cows. Lobbyists for the Cattlemen's Association recently confirmed they intend to use mRNA "vaccines" in cattle, which might affect both dairy and beef.
- Missouri House Bill 1169 would require labeling of products that can alter your genes. It would also require companies to share information about the potential transmissibility of gene-altering interventions, and asserts that fully informed consent must be given for all vaccines, gene therapies and medical interventions.

For the last couple of years, I've recommended not eating pork due to its high linoleic acid (LA) content, but there's an even bigger reason to avoid it now.

Since 2018, pork producers have been using customizable mRNA-based "vaccines" on their herds, and this has slipped completely under the radar. I myself just found out about it.

As described on Merck's animal health website:

> "A revolutionary swine vaccine platform, SEQUIVITY harnesses RNA particle technology to create customized prescription vaccines against strains of influenza A virus in swine, porcine circovirus (PCV), rotavirus and beyond. It's supported by a sophisticated dashboard filled with comprehensive data and insights …
>
> "Sequivity is a custom swine vaccine platform … Sequivity only targets swine pathogen gene sequences of interest. Doesn't replicate or cause disease, delivering pathogen information to the immune system … There's no need to transfer or handle live material like autogenous, killed or modified live vaccines …
>
> "Targets existing and evolving swine pathogens, including diseases not covered by conventional swine vaccines. Allows for the creation of multivalent formulations by blending RNA particles to target multiple swine pathogens in one shot."

First RNA 'vaccine' for livestock licensed in 2012

Merck was not alone in developing veterinary mRNA shots, however. They weren't even first on the scene, although they later acquired the company that started it all.

The very first RNA-based livestock vaccine, a swine influenza (H3N2) RNA shot, was licensed over a decade ago in 2012, and was developed by Harrisvaccines. The company followed up with an avian influenza mRNA shot in 2015. Harrisvaccines was acquired by Merck Animal Health later that year.

CureVac developed an mRNA-based rabies shot for pigs in 2016. (On a side note, they began conducting human rabies shot trials in 2020 in response to the World Health Organization's goal to achieve "zero human rabies deaths by 2030.")

In 2016, Bayer also partnered with BioNTech to develop mRNA "vaccines" for both livestock and pets, but it doesn't appear they ever launched anything.

So, in retrospect, it appears Americans have been eating pork treated with gene therapy for the past five years, and even more of our meat supply is about to get contaminated with the same treatment.

In addition to the avian influenza RNA shot for chickens licensed in 2015, newer mRNA-lipid nanoparticle shots for avian influenza are also in the works.

Iowa State University is also working on an mRNA shot for cows, and lobbyists for the Cattlemen's Association recently confirmed they intend to use mRNA "vaccines" in cattle, which might affect both dairy and beef.

Merck and Moderna: Partners in mRNA jab race since 2015

The same year Merck purchased Harrisvaccines (2015), it also entered into a partnership with Moderna to develop a number of undisclosed mRNA "vaccines." It was slated to be a three-year collaboration, with a one-year optional extension, in which Merck would perform research and development and commercialization of five potential products using Moderna's mRNA technology.

As reported by Genetic Engineering & Biotechnology News at the time:

> "Moderna has agreed to design and synthesize the mRNA product candidates directed against selected targets through its mRNA Therapeutics™ platform.
>
> "The platform builds on the discovery that modified mRNA can direct the body's cellular machinery to produce nearly any protein of interest — ranging from native proteins to antibodies and other entirely novel protein constructs with therapeutic activity inside and outside of cells."

Endless customization, zero safety testing

Sequivity, introduced in 2018, was one of the products that came out of that partnership. As explained by Merck (both on its website and in the video below), Sequivity is not so much a single vaccine as it is a platform that can be endlessly customized — all without additional safety analyses over and beyond the initial ridiculously inadequate testing.

As noted by Zoetis, the largest producer of veterinary drugs and vaccines:

> "Sequivity has safety and efficacy studies based on the platform with a historical initial isolate, not likely the isolate that customers would be requesting in their product."

Sequivity is customized as follows:

1. Pathogen is collected and sent to a diagnostic lab.
2. The gene of interest is sequenced and sent electronically to Sequivity analysts.
3. A synthetic version of the gene of interest is synthesized and inserted into the RNA production platform.
4. The RNA particles released from incubated production cells are harvested and formulated into a customized "vaccine."

Using this platform, a customized "vaccine" can be created in as little as eight weeks. Now, what could go wrong by not testing every new shot for safety?

In my view, there is any number of safety hazards, as every pathogen has distinct effects, and tricking the animal's body to produce that pathogen (or a pathogenic portion of that pathogen, as done with SARS-CoV-2) can have wildly unexpected side effects.

We've clearly seen this with the SARS-CoV-2 spike protein in humans. Pfizer's own documentation lists 158,000 recorded side effects, and many of these diseases and conditions have never before been reported in response to a vaccine.

I reviewed this evidence in "Newly Released Pfizer Documents Reveal COVID Jab Dangers" and "CDC Aware of Hundreds of Safety Signals for COVID Jab."

Yet despite the obvious risks, the U.S. Food and Drug Administration has gone ahead and authorized updated COVID shots to be released on an annual basis without additional safety testing, and apparently safety testing of mRNA shots used in animals was foregone nearly five years ago!

The risk of dangerous side effects is one of the reasons why not all conventional vaccines work out. Some simply cause too many problems. Now we're to believe that the possibility for dangerous side effects doesn't exist just because we're forcing the body to produce the antigen internally?

If anything, the possibility for problems is higher than ever, as exposure to the antigen is continuous for a long period of time, possibly for the life of the animal.

Even organic pork producers can use mRNA shots

Unfortunately, due to search engines now only providing a short list of curated and heavily censored content, it's been impossible to determine how many pork producers in the U.S. use Sequivity.

Without that data, I recommend erring on the safe side and avoiding pork altogether, including organic pork, as organic standards do not have any rules on the use of vaccines, mRNA-based or otherwise.

Seeing how the Sequivity platform has been around for nearly five years already, it seems reasonable to assume nearly all large-scale swine producers have made this transition.

What do the cells in mRNA-treated meat contain?

The question now is, how do mRNA shots affect the meat?

For now, this is speculative, as we do not know whether veterinary mRNA shots are substituting uridine with pseudouridine, as was done in the COVID-19 shots. But if they do, then one of the obvious concerns would be that the mRNA might end up in the final meat product that you eat because this substitution makes it extremely difficult to destroy.

As explained by Dr. Peter McCullough:

> "Natural RNA is made of two purines adenine and guanine and two pyrimidines cytosine and uracil.
>
> "The replacement of uracil with its ribose ring (uridine) with N-1-methyl-pseudouridine, a synthetic product makes the genetic code for the Wuhan Spike protein better stabilized on lipid nanoparticles, long-lasting, and very efficient in terms of evading cellular destruction and able to undergo repeat reading by ribosomes for continued protein synthesis.
>
> "Morais et al indicate that both Pfizer and Moderna chose development strategies replacing all uridine units with pseudouridine, making the entire strand completely 'unnatural' to the human body. Thus vaccine consultants, companies, and patients unfortunately gambled on how long mRNA would be active within the human body.
>
> "Fertig et al found lipid nanoparticles with mRNA were measurable in plasma for — 15 days. Recently, Castruita et al demonstrated mRNA in blood out to 28 days. Röltgen et al have found mRNA in lymph nodes 60 days after injection.
>
> "None of these studies demonstrated complete clearance of mRNA from a group of patients.
>
> "This is worrisome since injections are recommended in some populations just a few months apart implying there will be stacking of long-lasting mRNA in the body without adequate opportunity for clearance and elimination.
>
> "We will look back for many years and ask: how could so many people readily accept injections of heavily modified synthetic genetic code giving the body instructions to manufacture a disease promoting and lethal protein engineered in a biosecurity lab in Wuhan, China?
>
> "Repeated administrations of mRNA studded with apparently indestructible pseudouridine may have changed the course of lives forever."

If mRNA shots can cause significant disease in humans, how has it affected our pork supply for the last five years? And how will it affect beef and chicken in the future? Can consuming genetically manipulated meat affect your health? These are questions that currently do not have answers and must be thoroughly and comprehensively investigated.

Big Ag didn't tell us what they were doing

One of the most frustrating aspects of this is that the industry didn't tell us they were using novel gene therapy to spin up customized "vaccines" in weeks without any safety testing. The only reason many of us became aware of this issue in recent weeks was because attorney Tom Renz started warning about it.

In an April 2 Substack article, Renz wrote:

> "I have been talking about gene therapy vaccines being introduced into the food supply without providing people informed consent on my Twitter account … as well as pushing Missouri HB1169 which is our best bet of stopping this happening.
>
> "This is a nightmare scenario whereby people's genetics are potentially altered with 'factory foods' without them even knowing. Let me begin by putting to rest any questions as to whether this can happen. The idea of vaccines in food has been around for a long time …
>
> "Here is an article published in the NIH (you know — by our government) talking about foods 'under application' to be genetically modified to become edible vaccines — FROM 2013 … The fact that food can be altered to act as a vaccine is not disputable.
>
> "Which foods and in what ways is more of a question. It is claimed that beef, pork, etc. cannot transfer vaccination from the meat to the consumer of the meat. At initial glance that would make sense (cow DNA and people DNA is quite different and an mRNA designed for cows would probably not be able to transfer directly to people), but that is NOT the whole story.
>
> "You have to remember that the additives in the mRNA vaccines are by no means 'proven safe' and we don't even actually know what all is in these shots … Ultimately the mRNA jabs still have not undergone long-term testing because long-term testing can take 10-20 years and they have not existed that long so any claims about the safety or efficacy of the stuff that's in them are garbage at best.
>
> "What we do know about the mRNA vaccines is that they do not stop the spread of disease … and really do not help in any way with anything. We also do know that these jabs were demonstrated, in vitro, to alter the genetic makeup of some cells and I would say it is incredibly likely that they do the outside the Petri dish.
>
> "Given that we are now talking about a new level of genetic engineering with unknown effects and no long-term studies, do the potential genetic changes the mRNA injections facilitate pose a long-term risk to humans that ingest the altered food? Before you say no, wouldn't you prefer it be tested rather than being the subject of the experiment?"

Support Missouri House Bill 1169

As noted by Renz, Missouri House Bill 1169 would require the labeling of products that can alter your genes. It also asserts that fully informed consent must be given for all vaccines, gene therapies and medical interventions, and would require companies to share information about the potential transmissibility of gene-altering interventions.

The pushback by industry against this bill has been enormous, which should tell you something. It doesn't ban anything; it only requires transparency. That, apparently, is a serious threat to industry, and the most obvious reason for that is because they'd have to admit that all sorts of foods can have gene-altering effects.

Not only might this destroy Big Ag, but it would also decimate any surreptitious attempts by Big Pharma to use the food supply as a tool to distribute vaccines unbeknownst to consumers.

As noted by Renz, "Big pharma DOES NOT WANT people to know they are going to use food to alter their genetics."

Farmers are also being set up as the fall guys, and they need to be made aware of this.

Renz states:

> "The lobbyists opposing this bill … are pushing to shut this bill down because factory mega-farmers like Bill Gates, the CCP, and others want to put vaccines in your food. These guys are supporting the big money but this will come at the expense of the family farmers.
>
> "The problem is that the major factory farmers like Gates have legal teams that can set up defense shields against the torts that may come if the food supply starts poisoning people …
>
> "Meanwhile, the small farmers will be at risk of being sued if it turns out that the food they are selling is unsafe despite the fact that most of them will not necessarily know what is happening.
>
> "If the corn growers, soybean, cattle, and pork associations actually cared about the farmers they would be demanding the seed companies and vaccine manufacturers indemnify the small farmers for these products rather than opposing a bill that would force them to tell the farmers what they are doing.
>
> "The corruption regarding this bill is amazing. Ultimately the labeling requirement would likely serve to protect farmers from being sued because the makers of seed and vaccines would have to make sure the farmers knew if they were putting potential gene therapies into their products. The opposition from the ag lobby is not to help the farmers, it is to help their own pockets."

As noted by Renz, if this bill is passed in Missouri, it could help protect the food supply of the entire U.S.

In the meantime, I recommend avoiding all pork products, including organic ones, as they not only have high levels of the omega-6 fat, linoleic acid, because of the grains they are fed, but virtually all have been contaminated with the mRNA vaccines for the past five years.

7 days ago
Not all of us can eat fish etc. They're shrinking the food supply and it is inevitable that there will simply be less food, period. It'll be "eat the bugs" or go hungry.

Whether it's vaccines or some other threat in our food, it's best to find a local farmer who uses humane management practices. It's fairly obvious that the meat we get from the grocery is industrial farm product regardless of the 'grass fed' or pasture raised jargon.

Thank you for this information; I was totally unaware! The only safe way to consume almost anything these days is to raise it yourself, or know personally who you're buying it from. Since I live in the country, that is possible for me, but I will have to get to work on it!

"God keeps evil here?" Not sure what that comment is about. People are perpetrating this evil & many others just for money. Great people are also fighting back, thank goodness! There are definitely forces of good & evil, but God is never the source of evil; His desire is to set us free from it & its entanglements!
4 0 Reply • Share ›

bluefeather100 → trmlogan

Clare Goldsberry
7 days ago
I suppose it's time for all of us to become vegetarians. I can't believe they would vaccinate chickens given that their life-span from hatch to slaughter is so short (about 6 months), given that my family had a chicken hatchery when I was a kid. My brother raises pigs – I'll check with him and see if he can have one killed for me that does not have any mRNA crap in it.
5 2 Reply • Share ›

Polly Green → Clare Goldsberry
7 days ago
A lot of specialty meat producers are now advertising that they don't vaccinate. The place I buy my corn free meat is one--Circle C Farms in Florida. Yes, you pay the shipping, but it is a superior product anyway. In my inbox this morning was their email emblazoned with "We do not vaccinate our pigs!" There are numerous others all over the country. Let's support them.

As intriguing as this all sounds, it doesn't make sense. People eat pork and chicken constantly and even the best doctors know that ingesting or giving "vaccines" on a daily/weekly basis would be disastrous. Death or substantial injury would be inevitable.

It makes perfect sense when you understand the globalists agenda is to depopulate the world. And the myriad of ways they are doing it is truly diabolical. GMO's, bioengineered foods, vaccines, 5G (and all the other "G's", chemtrails, smartphones, chemicals and pesticides, gene editing are just some of the ways they are attacking humanity.

Mercola picked up on some preoccupied individual (Renz) and yarns the scary story.
I have been eating pork all my life, and keep eating it. The assumption that mRna shots delivered to cows or pigs, or anything else will alter my DNA is utter nonsense. Cooking, or barbecuing will destroy and desintegrate anything POTENTIALLY 'not good' in meat + digestion process as well. The same applies to GMO, or gene edited food(the latter is a brand new trend). Lets not get PARANOID. Food in your stomach cannot act by reverse transcriptase to your genes ! !...jabs into your circulatory system CAN. TWO DIFFERENT THINGS...

👍 3 👎 13 Reply • Share ›

Siglund ➜ Voyt Regnal
7 days ago

Well, unfortunately we've ALL been "misdirected" once again. The payload of the shots for humans and for animals is GRAPHENE. It is not a protein. It's a 2D nano-molecule that "integrates" into tissue and passes freely through tissues, membranes, etc. This is the source of the "shedding" phenomenon. Someone somewhere (we sorta think we know who) wants all life on the planet to be saturated with it. What's the purpose? Nobody knows for sure, but it's suspected that it can be used for monitoring, control, and possibly extermination. So what happens when you eat meat from an animal injected with this substance? It passes through your stomach wall and/or intestinal wall and into your body, much into your bloodstream. Dr. Andreas Noack revealed that the substance can be compared to "nano-razor-blades", which would explain the destruction of human circulatory systems, including the heart, which is the likely cause for all the sudden deaths.

I believe it's been proven not to be graphene. The problem with the COVID vaxx is the spike protein and the lipid nanoparticle that is used to 'stabilize' the spike. Both cause the problems.

👍 2 👎 0 Reply • Share ›

Voyt Regnal ➜ Siglund

Food Supply at Risk? mRNA Is "Far More Durable Than We Could Have Ever Imagined"

It [mRNA] is made now with a synthetic pseudouridination, which makes it highly efficient but resistant to breakdown with ribonucleases," explained Dr. McCullough.

"This means that food in various forms could actually have messenger RNA. Now the Chinese have shown that it can be ingested. One approach [to stop this] would be to ban all forms of messenger RNA technology in animals — period! So we don't have any threat of this coming through the food supply."

👍 7 👎 2 Reply • Share ›

Exactly how do you think many things end up "in" the blood?? A basic course in biology will tell you that what you eat will end up affecting your blood... How do you think people that are iron deficient end up raising their iron levels to normal. It's what they EAT.

👍 4 👎 1 Reply • Share ›

Voyt Regnal ➜ RemembertheAlamo
6 days ago edited

You definitely need some extra reading in order to understand. Swallowing iron supplements does not involve altering genes, or has nothing to do with genetics. Just because you swallowed some kind of decomposed remnants of RNA, does not mean that you will become Frankenstein with altered DNA 😩
Mercola excells, unfortunately, in spreading panicky stories without much credibility and people fall into it 😤

While it is true that stomach acid will destroy much of the toxins in this product ; there is the issue of the synergy and cumulative properties of all the pathogens & toxins in our food air ,water and medicines. These are considerable and fast becoming more than our bodies/ livers can handle. Especially with the massive doses of antibiotics [which don't break down], metals and herbicides,pesticide & fungicides. In 1986 the FDA allowed drug companies to start adding fluorine to 100s of drugs; because they allowed them to go in longer, stronger, faster, , deeper and could be added to an old drug to patent it as a newer more expensive one. Fluoroquinolones were prime example. Unlike regular antibiotics which target bacterial nucleus or shell; these products [Cipro,Levaquin,Avalox,Gemofloxin etc] ALTER THE DNA OF BACTERIA AT THE POINT OF REPLICATION. Since antibiotics don't differentiate between good & bad bacteria; now you can't grow back the good stuff. Also humans have more bacterial cells than mammalian cells and it alters those as well. After 30 years at 30 million scripts sold each year there are now black box warnings for tendon rupture, tendonitis, permanent peripheral neuropathy, aortic aneurism & stricture because your connective tissue recovery & growth has been destroyed. Levaquin was taken off market [J&J] from more pending lawsuits involving delayed retinal detachment. So our DNA has been altered for at least 37 years and not for the better.

It does not have to be either or. We do what we can. Go to www.slweb.org and click on the FTRC link for a list of 360+ fluorinated drugs to avoid. All have cheaper ,safer, effective alternatives. Remember; unless you are in a hurry to die, that doctors and hospital medical mistakes are the number 3 cause of death in USA.

Thanks for the lines and the link. I will save it, though at this stage of my life (getting old no doubt 😕), I am not taking any pharmaceuticals. In case of any need, I plan to consult with naturopathic doctor on top of my GP.
Good luck with your health.

Thank you. Mercola has some good information but a lot of clearly misleading bunk mixed in. And he's a salesman.

The whole gene altering theory is nonsense, because the whole genetic is refuted. The mRNA of all vaccines has zero effect. There is no virus and there is no „spike protein“.
The shots can be deadly and can cause illness, because the nanolipids are highly toxic. And so the question has to be answered, how much of that poison can we get into our bloodstream by eating vaccined meat ? I don't know, and no scientist wants to know either.

And how much of that poison is in our water that we drink and water our garden with? How much of it is in our blood supply?
